Project MindMirror

Esmeres - Malquisto | 8 - Sampaguita

Problem Statement

Test results often become a basis for comparison, creating an environment where students who score less may feel discouraged, embarrassed, or even undervalued. This can foster unnecessary competition, dividing students rather than collaborating to work together.

Objectives

- Develop a Puzzle-Based Assessment System
- Allow program functionality
- Create an engaging user interface
- Use an effective method for scoring
- Cite sources used for the development of this project

Methodology

• RESEARCH & CREATION

- Began research on effective questions for the 6 types of intelligences the project will utilize.
- Started designing a simple, minimalistic design for the main menu interface, and for the UI design in the questions part.
- Creation of a scoring system used to interpret a user's performance into a scoring metric with the usage of a polar bar chart.

Methodology

- DOCUMENTATION

- Started on an initial draft regarding the project proposal, features, problem statements, and so on.
- Updated documentation of readme, project proposal, problem statements, objectives, progress reports, and more.

Methodology

- TECHNOLOGIES

- VSCode as the main Python IDE for coding the program
- AI Platforms for assisting in the organization and compilation of projects.

Methodology

- TRADE-OFFS

- With the complexity of implementing GUIs in Python and the shortening of time, a drop in the quality of design may emerge.
